QA Test Task

Along side this task there should be an OpenAPI specifications describing a currently working system.

Please design a test suite for this system. There's no need to design the suite for the whole system, rather you're free to pick a few endpoints and design the tests that would fully cover chosen endpoints.

It is not necessary to write actual tests (no code), rather describe testing scenarios you would create to adequately test the system according to the API spec provided.

Ideally we'd like to see:

1. An accurately described JIRA ticket with whatever information you think is necessary.

    1. Title: …

    2. Description: …

2. Describe the test tools you would use and why, for example, SoapUI, Gherkin, Postman, JMeter, etc.

3. A few sample tests (without any programming) using your preferred tools.

Things to keep in mind: our services communicate with each other via REST API, occasional 3rd party vendor would communicate via XML (SOAP), and our stack is mostly PHP with some C#, if that matters.
